# Uncontrolled Three-phase Half-wave Rectifier

❖ The diode in a particular phase conducts during the period when the voltage on that phase is higher than that on the other two phases.

❖ The conduction angle of each diode is  $2\pi/3$

❖ Applications:

- Battery charging
- Electrolytic processes
- Simple DC supply circuits where low cost is prioritized over performance

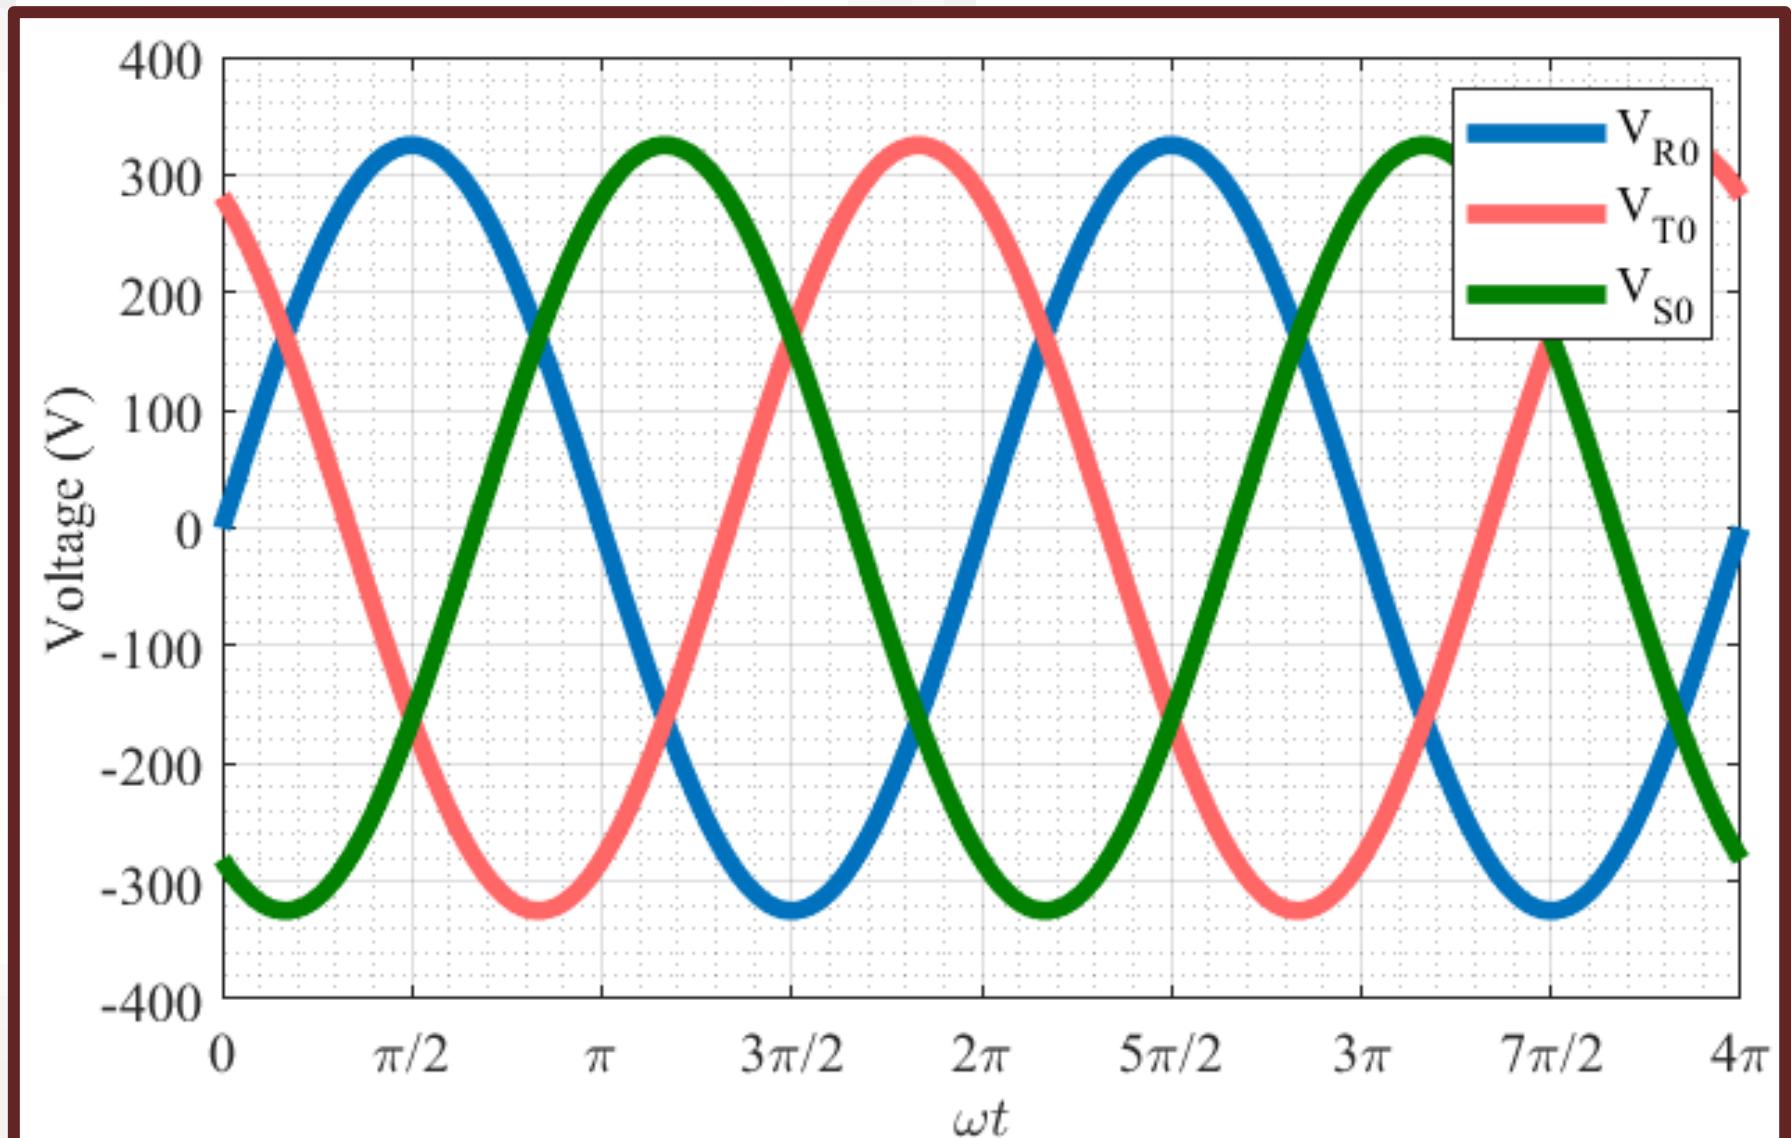

**Advantages:**

- Simple design and easy to implement
- Fewer components (only three diodes)

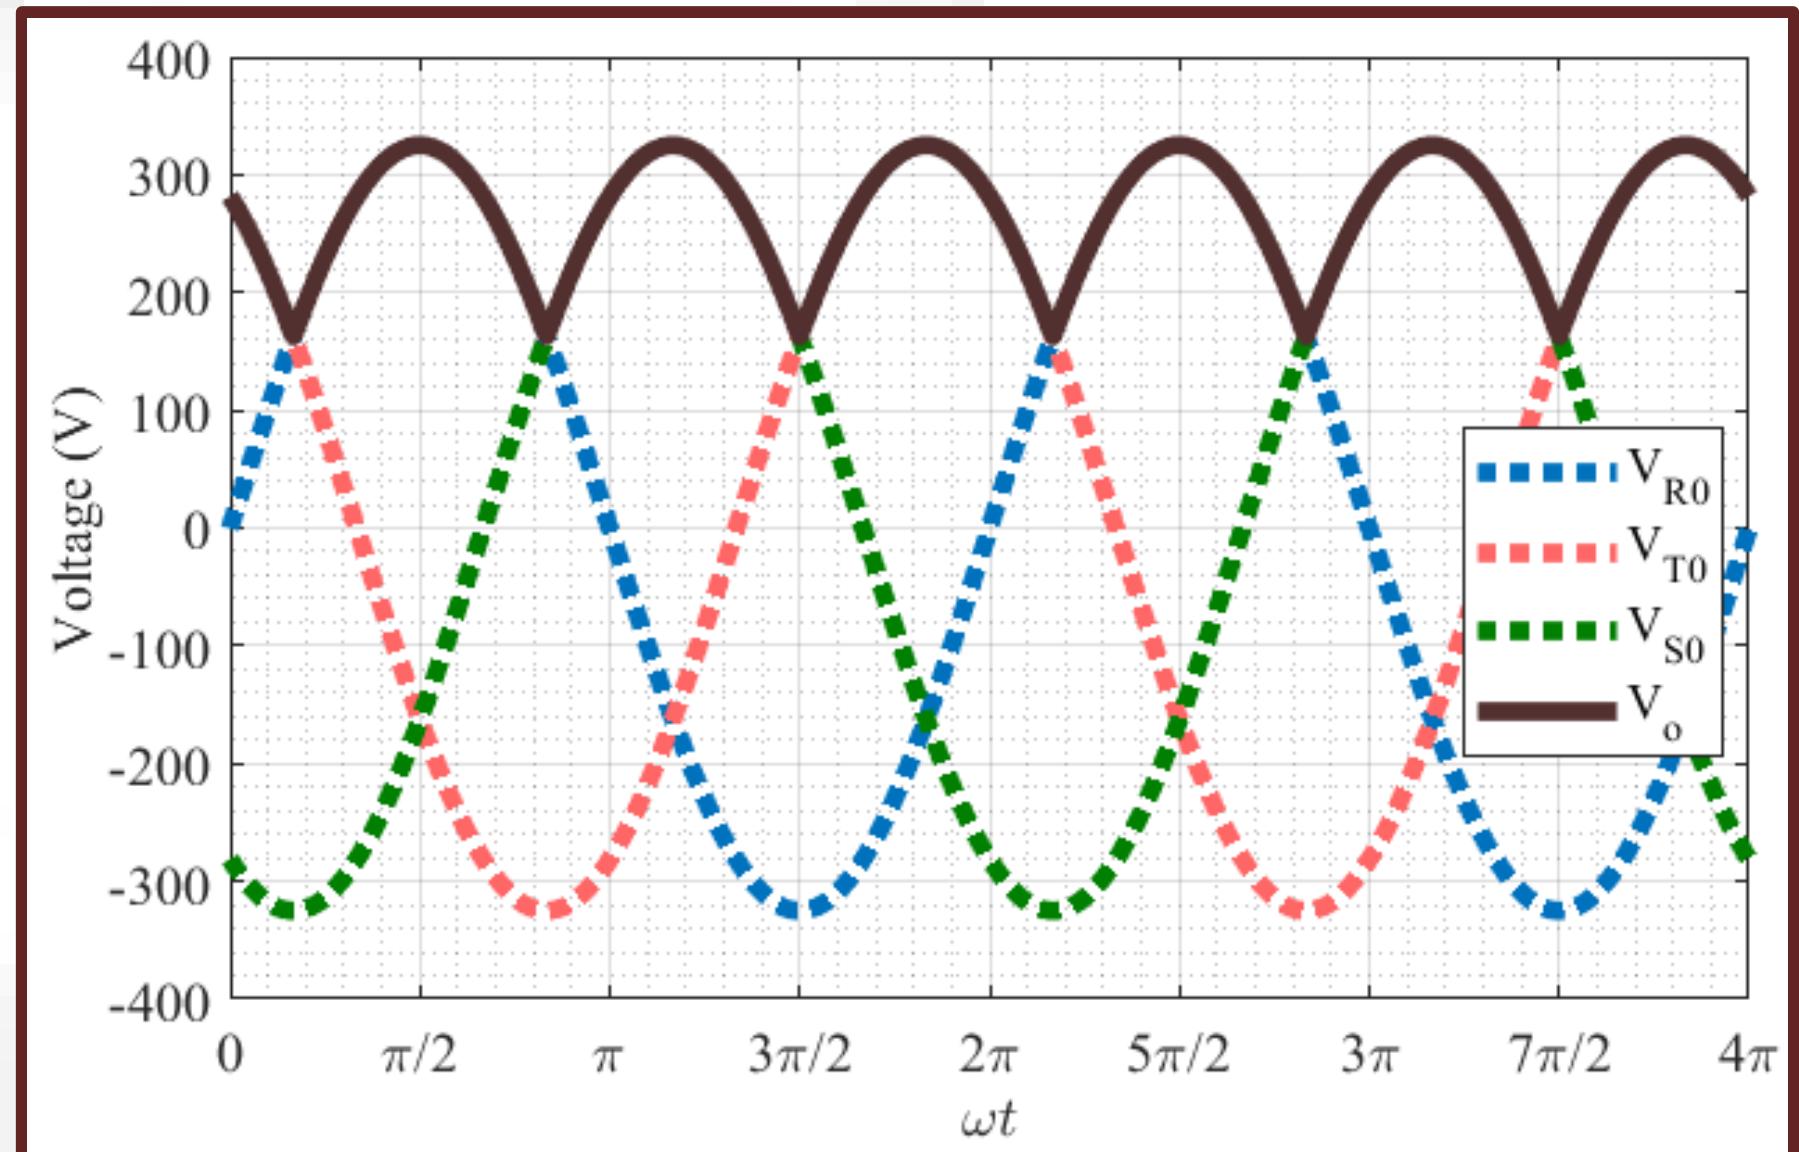

**Disadvantages:**

- High ripple in the output voltage
- Limited to low and moderate power app. due to the neutral return path requirement
- Diodes must handle high peak currents

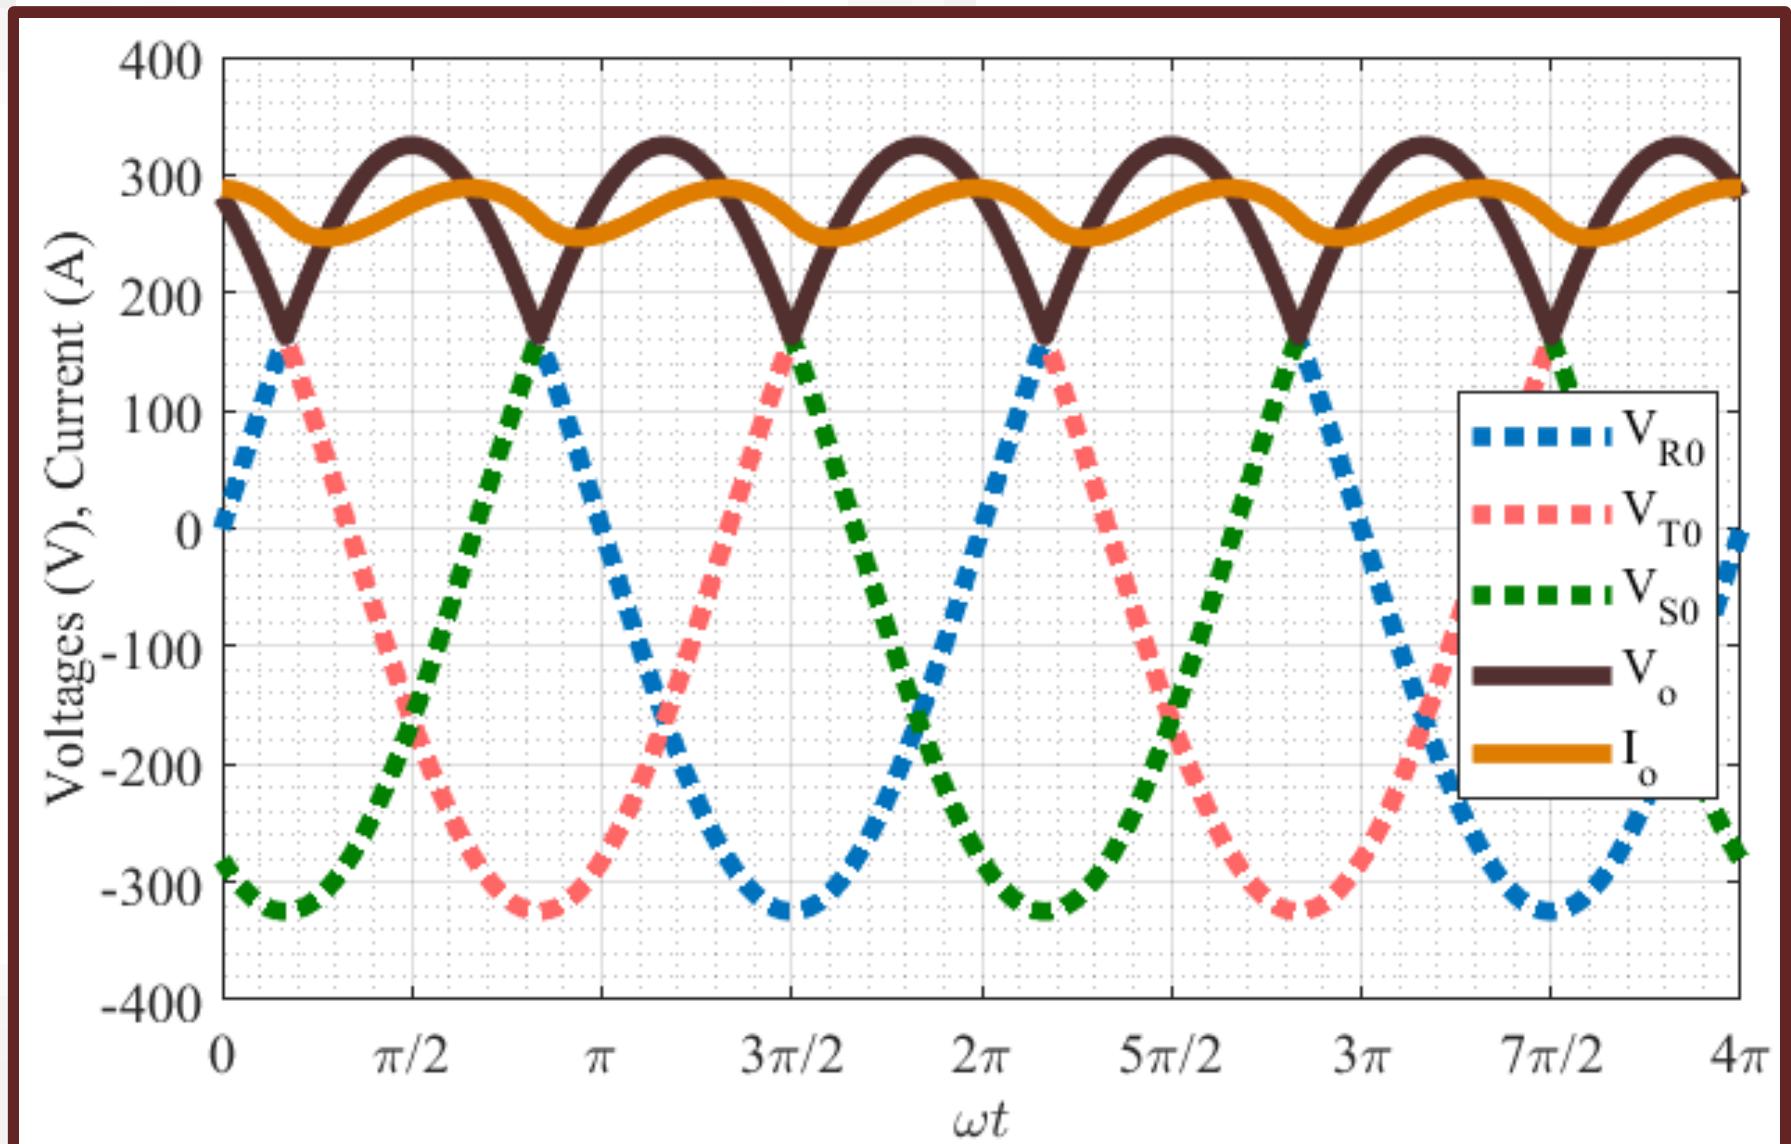

# Uncontrolled Three-phase Half-wave Rectifier

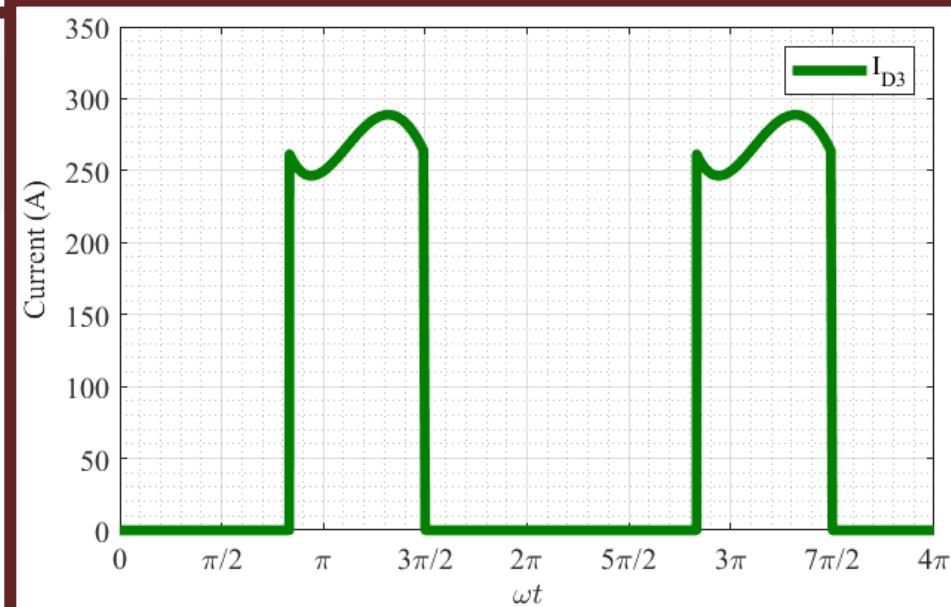

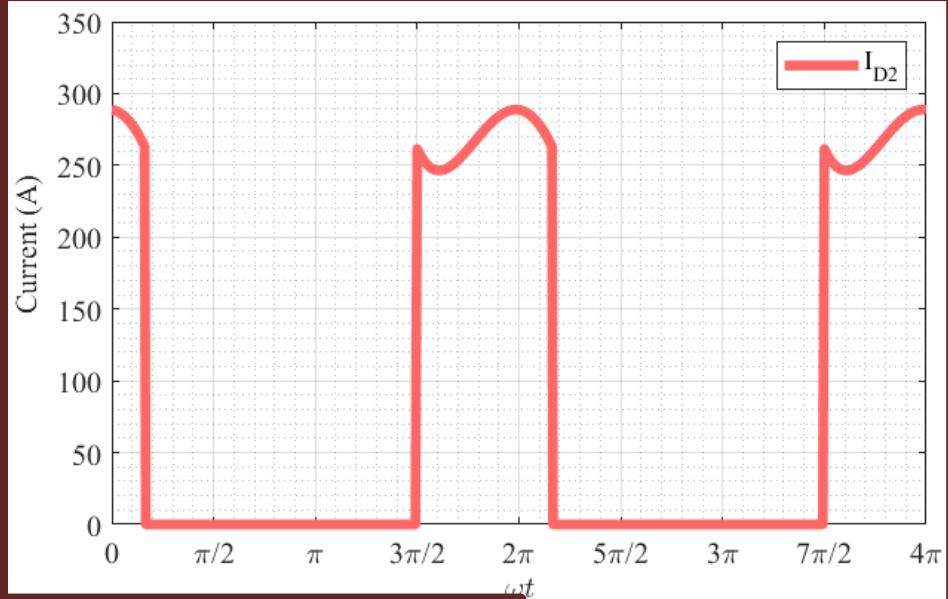

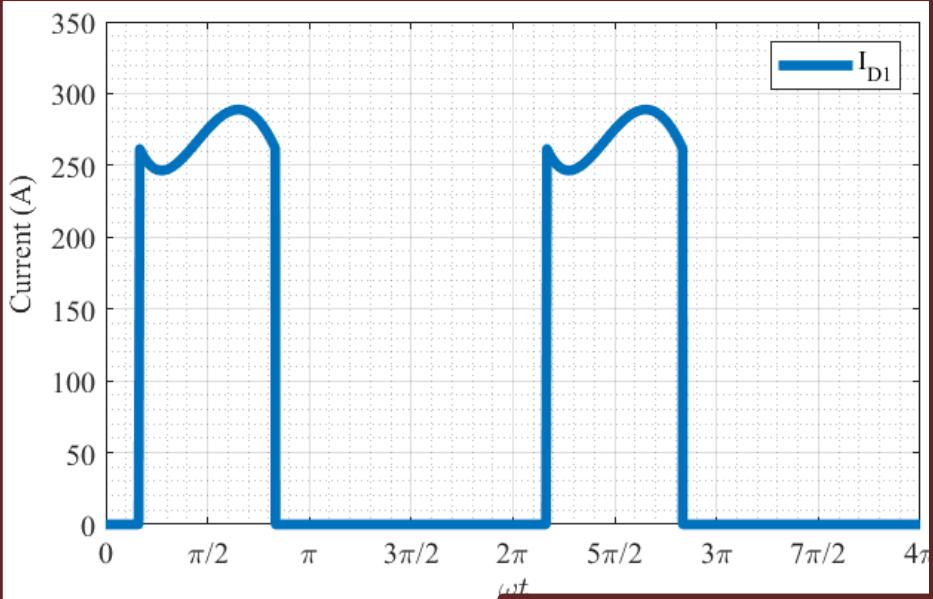

# Uncontrolled Three-phase Half-wave Rectifier

If we assume that the load is highly inductive, the load current can be taken to be smooth and ripple free.

# Uncontrolled Three-phase Half-wave Rectifier

# Uncontrolled Three-phase Half-wave Rectifier

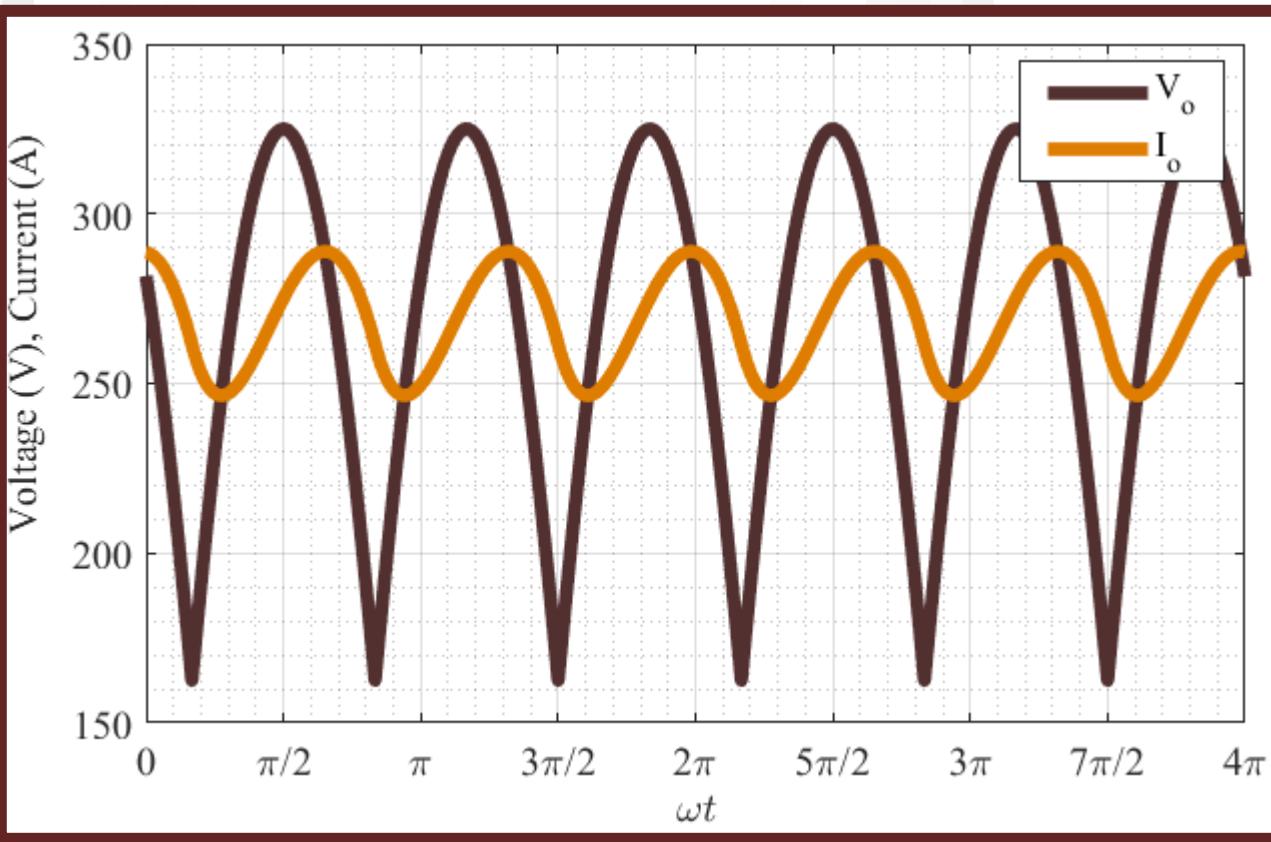

$$V_{R0} = V_m \sin(\omega t)$$

$$V_{S0} = V_m \sin(\omega t - \frac{2\pi}{3})$$

$$V_{T0} = V_m \sin(\omega t - \frac{4\pi}{3})$$

$$V_o \text{ (AVG)} = \frac{1}{2\pi} \int_{-\pi/3}^{\pi/6} V_m \sin(\omega t) d(\omega t) = \frac{3\sqrt{3}V_m}{2\pi} = 0.827V_m$$

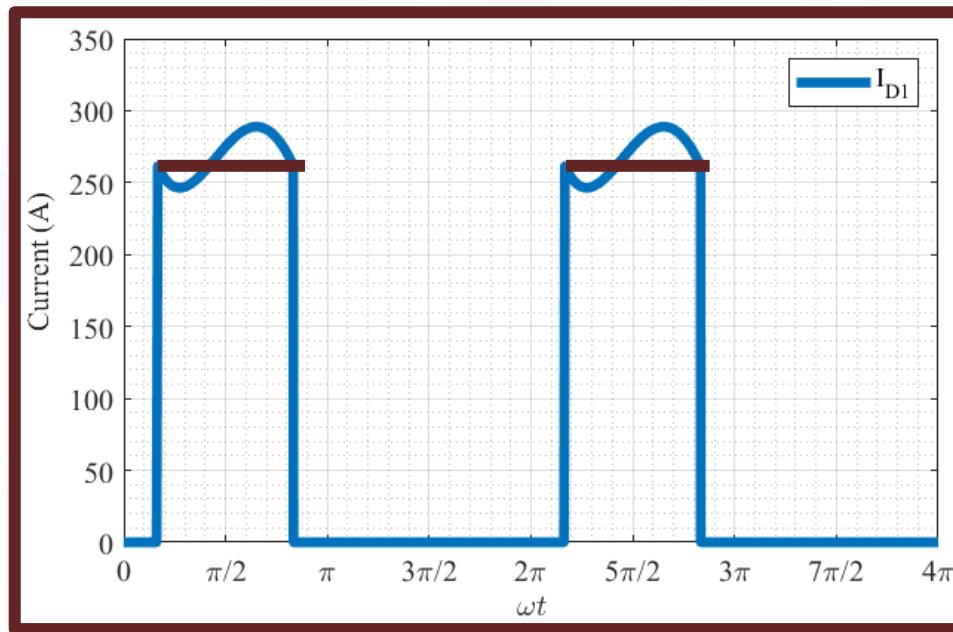

# Uncontrolled Three-phase Half-wave Rectifier

$$I_{o \text{ (AVG)}} = \frac{V_{o \text{ (AVG)}}}{R}$$

$$V_{o \text{ (RMS)}} = \sqrt{\frac{1}{2\pi} \int_{-\frac{5\pi}{6}}^{\frac{5\pi}{6}} [V_m \sin(\omega t)]^2 d(\omega t)} = 0.84V_m$$

# Uncontrolled Three-phase Half-wave Rectifier

The rms current in each transformer secondary winding can also be found as:

$$I_s = I_m \sqrt{\frac{1}{2\pi} \left( \frac{\pi}{3} + \frac{\sqrt{3}}{4} \right)} = 0.485 I_m$$

$$I_m = \frac{V_m}{R}$$
